
mod_purps_ranking

Posted by adroussel - 2008/09/24 10:33

Hi

I just uploaded a simple ranking module for purps. It uses some code from Steve-O-meter's puarcade featured module moded to fit Purps.

Hope it helps

Thank you for the Share adroussel :)

but for me it won't work :(

i installed it on joomla 1.0.13 and published it without a Luck. It destroys the Template of my Site. But a Fault Message is not there.

Greetings Tina123 :)

Hi Tina....

If you click on the detail view, you'll see this package is J1.5 native... Yes... again... :unsure: Maybe Tinker can help...

Pragma, In the community download, maybe add the joomla version in the category view also...

It should work fine on Joomla 1.5, can anyone confirm ?

okay so my Mistake for not checking the Deatails :)

Anyway again great Work adroussel :)

It works great in joomla 1.5.7 and its a very nice module!
Only the "View your stats" link is going nowhere

When I mouse over this link I see:
<http://www.xxxxxx.com/index.php?Itemid=1000114>

When I click on it I get a white page with the tekst:
Fatal error: Unsupported operand types in /home/ruud66/public_html/test/includes/router.php on line 140

Hope this helps? :cheer:

mine looks like:

index.php?option=com_purps&Itemid=1000114

Itemid should be replaced by yours in the module parameters

1000114 is default but it is mine

try this should fix it

if not try to reupload the php file or reinstall it

Btw I see the module has disappeared from the downloads when categories have been added...?

I'll put it back if you need

let me know

@Pragma and adroussel,

During installation I did see it but for some reason I ignored it, I feel so stupid :blush:

But now it works,... thanks a lot!

:woohoo:
