---

Hi

I've got Pu arcade installed and working, have worked out how to install games, but have no idea how to go from this: <http://www.play-wrestling-games.org> to a proper looking arcade... Are there any tutorials or sites that might help me move forwards?

Thanks

=====

I just tried to change the template from within the PUARCADE section of the admin in Joomla on my site and it came up with this error message: You don't have permission to access /administrator/index2.php on this server. Any ideas?

Chmod in ftp (filezilla example) the necessary php files. When the files 've 644 right,you don't have permission rights.

You've a lot of work to do

Delete the standard joomla contents.

Example : another joomla template,make a banner,install the joomla component community builder,install modules like this one

[http://www.pragmaticutopia.com/component/option,com\\_sobi2/catid,10/Itemid,143/](http://www.pragmaticutopia.com/component/option,com_sobi2/catid,10/Itemid,143/)

In the forum you find a lot of tutorials for modding pu arcade (for older versions) like playing full screen,js pop up,scoreboard,...

Install also modules like cb login and other cb plugins.

Also the modules players online,...

Make a .htaccess file with notepad

SecFilterEngine Off

SecFilterScanPOST Off

save not as txt file but as .htaccess file (all files)

---

put this file in the root of your joomla installation

thanks again.

I first tried adding this to the end of the .htaccess created by joomla, this did not work, so I deleted all that joomla had put in it, that also did not work.

I am currently looking on other forums for solutions.. no luck yet...

thought what you suggested I have just seen has been suggested else where.

Any further suggestions would be greatly appreciated.

Your joomla account ,example admin, have this super administrator rights?

View this in user management and update this one

yup has super admin rights, it's weird, no trouble making new directories, it's just changes to settings that it does not like...

The url does not go to anyone plug in, not sure what I need, have installed the community builder component, can not find the module player online...

I am struggling! but making some progress..
